Rare Earth Dependent

## Critical and Strategic Failure of Rare Earth Resources National Security and Industrial Policy Failures

The U.S. and the World find themselves dependent upon China for a group of minerals and metals that are critical to many commercial, environmental and defense applications. China's monopoly position is poised to capture emerging technologies and manufacturing facilities from around the world, in exchange for supply contracts. China's National Industrial Policy of Rare Earth Dominance cannot be challenged by private investment.

The U.S. must develop a National Domestic Rare Earth Refinery to Survive.
